Recon Using Spider foot

Lab 3: Recon

OSINT: It is a "Open Sources Intelligence Automation". It is a web-based tool.

Check spiderfoot actually functioning or not

In kali> command terminal> spiderfoot or app> Information gathering> Spider foot/OSINT

Analysis> spiderfoot or Execute

$ Spiderfoot –help

Now, First we need to config spiderfoot so that it can run,

$ ifconfig

$ spiderfoot -l IP_Address:80 or $ sudo spiderfoot -l IP_Address:80

Now click on link from the output screen.

It will open on browser. Choose "New Scan" option.

Now type the scan name and seed target.

For our example:

      Scan Name: google

      Seed Target: google.com

Seed target can be domain name, can be an address, can be sub domain, can be subnet, can be

email address, can be phone number, human name, user name etc.

Now select footprint and click on Run scan.

Once scan start, it actually starts crawling with data.

Here status will show as "Running", when it complete, status will gets changed.

Here we can see affiliate websites & addresses, graph and many more details.
